

**Course name:** Thesis (Final Course Project)

**Project name:** Pyrolysis of plastics for the production of sustainable alternative fuels for the marine sector

**By:** Sina Keyhani

### **Abstract:**

Large quantities of marine litter exist in marine environment. This litter poses a serious threat to the environment and human health, but they can be an interesting source for pyrolysis process to produce fuel for shipping sector. Shipping sector itself is shown to be transitioning towards cleaner fuels, especially in terms of sulfur content which fit the resulting oil from pyrolysis process.

The study examines the composition and distribution of marine litter across different environments, identifying beach and floating marine litter as the most suitable options for pyrolysis process. While seafloor litter can also be used, it requires the removal of large non-plastic foreign materials and addressing challenges posed by PA and PVC.

A literature review showed that several experimental studies were performed on marine litter pyrolysis, after careful analysis of these studies, the most comprehensive one was selected as a reference study. Furthermore, to show the variability of marine litter, several feedstock scenarios were formed, and heat and mass balance calculations were done on each of them.

Based on the results of theoretical calculations, an industrial unit was designed and economic and LCA of the process was performed. The results showed that while economically unfeasible in current scale, which is considered small, the process shows great scalability. Moreover, the process generates an order of magnitude less emission than incineration.

## Assessment of Marine Litter:

| Sea                        | Type of sampling    | Density (item/km <sup>2</sup> ) | Description   | Source |
|----------------------------|---------------------|---------------------------------|---|--------|
| Eastern Med. Sea           | Surface observation | 232±325                         | Plastic pieces were dominant then bags and bottles.                                     | [33]   |
| Central Med. Near Malta    | Surface observation | 1321±688                        | 91% were plastics and 4% woods. Mostly plastic fragments.                               | [34]   |
| Adriatic Sea               | Surface observation | 251±601                         | 91.4% were plastics. Mostly packaging materials. Bags and plastic pieces were dominant. | [110]  |
| Black Sea                  | Surface observation | 93.6±128.3                      | 96% were plastic made. Mostly plastic pieces.   | [49]   |
| Central Adriatic sea       | Surface observation | 175.3±180.6                     | 95% were made from plastics, and the rest were wood and paper.                          | [79]   |
| Baltic and North Sea       | Bottom Trawl        | 16.8 (NS), 5.07 (BS)            | Plastics consisted 80% of items caught.   | [58]   |
| Baltic and North Sea       | Bottom Trawl        | 70.7 (NS), 9.6 (BS)             | Plastic was found in 91.3% of all samples.  | [54]   |
| Antalya Bay, East Med. Sea | Bottom Trawl        | 13.3-651.1                      | Plastic is the most abundant, but weightwise rubber is the most abundant material.      | [74]   |

*Marine litter density based on item for several European Sea.*

| Sea                               | Type of sampling | Density (kg/km <sup>2</sup> ) | Description   | Source |
|-----------------------------------|------------------|-------------------------------|---|--------|
| Northern and central Adriatic Sea | Bottom Trawl     | 82 ± 34                       | Plastics are 80% in terms of number, and 62% in terms of weight, dominant waste.  | [82]   |
| Greek gulf, East Med.             | Bottom Trawl     | 6.7-47.4                      | Plastic was the dominant item (56%).  | [60]   |
| Southern Black Sea                | Bottom Trawl     | 80.68 ± 48.06                 | Number-wise, plastics were the most dominant waste type (69.03%). Weight-wise, it was 16.37%. 62.01% of the overall weight was for rubber which only had 2% of items. | [38]   |
| Catalan Coast, NW Med. Sea        | Bottom Trawl     | –                             | Plastic removal rate 0.74 ± 0.11 kg, accounting for 64.2% of marine litter in nets. Wood was second with 21.5%.   | [9]    |

*Marine litter density based on weight for several European Sea.*

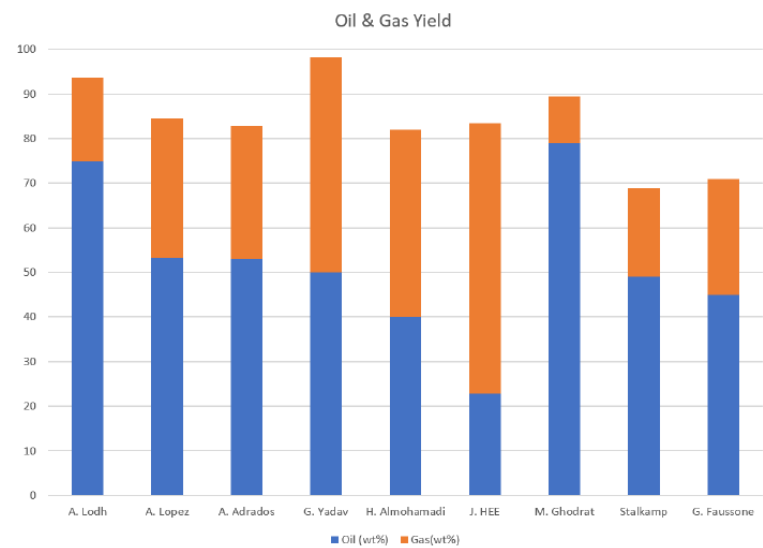

| Location      | Percent by number | Percent by weight |
|---------------|-------------------|-------------------|
| Europe        | 91%               | 64%               |
| Mediterranean | 81%               | 53%               |
| Black Sea     | 80%               | 57%               |

*Percentage of plastic waste by number and weight in different locations.*

| Location   | HDPE   | LDPE   | PP     | PS    | PA     | PVC   | PET    | Other |
|------------|--------|--------|--------|-------|--------|-------|--------|-------|
| North Sea  | 46.08% | 23.52% | 20.67% | –     | 6.65%  | –     | 0.95%  | 1.90% |
| Baltic Sea | 14.29% | 10.71% | 21.43% | 3.57% | 21.43% | 3.57% | 17.86% | 7.14% |

*Composition of seafloor plastics.*

Theoretical Calculations:

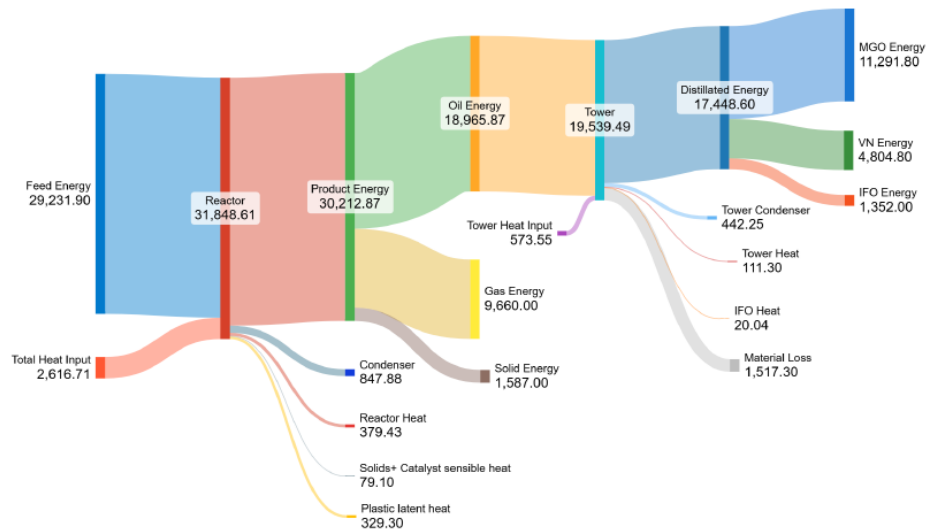

Comparison of plastic oil and gas yield from several pyrolysis experiments similar to marine litter pyrolysis.

Feedstock Case Studies used for calculations.

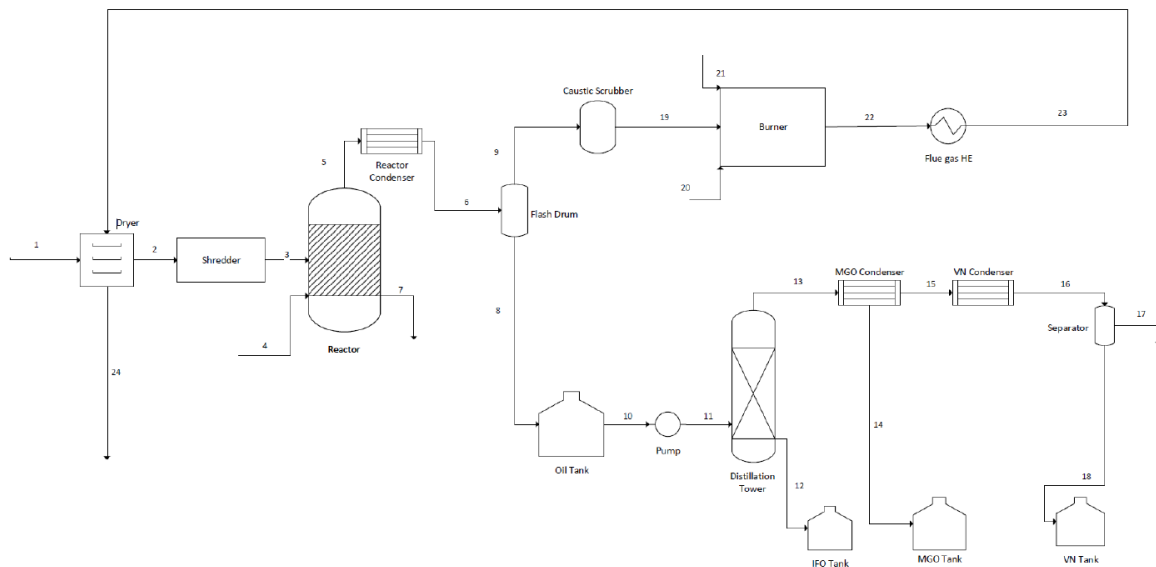

| Streams       | Beach (kg) | Floating (kg) | Seabed-1(kg) | Seabed-2(kg) |
